

AMENDMENTS TO THE CLAIMS

1. (Currently Amended.) A filing appliance which facilitates an interaction with a computer system, comprising: means for holding
a plurality of tangible sheets associated with a position coding pattern; wherein
at least one first input field ~~is provided with a position coding pattern and is adapted to be filled in by accepting markings from~~ a drawing device which ~~records, using said position coding pattern, positions in the input field in order to~~ digitally records information entered in the first input field;[[,]]
a second input field accepting descriptive information characterizing the digitally recorded information, wherein the descriptive information associates the filing appliance with an information object; and
an initiation icon ~~is provided, wherein a detection of the initiation icon by which, upon activation by the drawing device, is adapted to initiate an operation in a~~ signals the computer system ~~communicating with the drawing device, in which operation to create an information object is created, which is identifiable at least by means of~~ which is identified based upon the descriptive information entered in the second input field.

2. (Currently Amended) A The filing appliance according to claim 1, wherein said first and second input fields is are adapted to be filled in at least with text.

3. (Currently Amended) A The filing appliance according to claim 1 or 2, wherein said first input field is adapted to be filled in at least with an illustration.

4. (Currently Amended) A The filing appliance according to claim 1, wherein sheets in at least a subset of said plurality of sheets are provided with a position-coding pattern so that information filled in on a sheet in the subset by said drawing device is recordable as a digital graphical input, the filing appliance comprising a number of appearance icons, a ~~marketing~~ detection of an appearance icon by means of said drawing device being adapted to give the digital graphical input a visual property.

5. (Currently Amended) A The filing appliance according to claim 4, wherein said visual property relates at least to stroke weight.

6. (Currently Amended) A The filing appliance according to claim 4 or 5, wherein said visual property relates at least to line color.

7. (Currently Amended) A The filing apparatus according to claim 1, which comprises an address field provided with a position-coding pattern, and an order icon, a detection of the order icon by said drawing device being adapted to initiate an operation in the computer system which operation performs an order of another filing appliance to be delivered to the address entered in the address field.

8. (Currently Amended) A The filing appliance according to claim 1, wherein at least two sheets in a subset of said plurality of sheets are provided with a position-coding pattern, so that information filled in on a sheet in the subset can be recorded by said drawing device as digital graphical inputs, and a send icon provided with a position-coding pattern, a detection of the send icon by means of the drawing device initiating an operation in the computer system, in which operation graphical inputs entered on the sheet are transferred to the computer system and optionally on to an external computer system.

9. (Currently Amended) A The filing appliance according to claim 1, wherein said information object comprises a table in a database.

10. (Currently Amended) A The filing appliance according to claim 1, wherein said information object comprises a file.

11. (Currently Amended) A The filing appliance according to claim 1, further comprising an archiving icon, detection of the archiving icon by the drawing device being adapted to initiate an operation wherein position information corresponding to strokes of the

drawing device, which strokes are generated after a reference time point, is transmitted from the drawing device to the computer system.

12. (Currently Amended) A system for information management, comprising:
a drawing device adapted to record a position coding pattern;
a computer system communicatively coupled with the drawing device; and
a filing appliance which further comprises, a drawing device and a computer system, the
filing appliance comprising: means for holding
a plurality of tangible sheets associated with the position coding pattern,[[;]]
at least one first input field which is provided with a position coding pattern and
adapted to be filled in by accepting markings from the drawing device which is adapted
to record, using said position coding pattern, positions in the input field in order to
digitally records information entered in the first input field,[[;]] and
a second input field accepting descriptive information characterizing the digitally
recorded information, wherein the descriptive information associates the filing appliance
with an information object, and
an initiation icon wherein a detection of the initiation icon which, upon activation
by the drawing device, initiates an operation in said computer system, which is adapted to
communicate with the drawing device, where signals the computer system to create an
information object is created, which is identifiable at least by said identified based upon
the descriptive information entered in the second input field.

13. (Currently Amended) The A system according to claim 12, wherein the computer system is integrated with the drawing device.

14. (Currently Amended) The A system according to claim 12, wherein the filing appliance comprises an archiving icon, ~~which is arranged~~ wherein a detection of the archiving icon by the drawing device initiates an operation wherein position information corresponding to strokes of the drawing device, which strokes are generated after a reference time point, is

transmitted from the drawing device to the computer system.

15. (Currently Amended) The A system according to claim 14, wherein the reference time point is set updated to the current time in connection with during the transmission of the position information to a time contemporaneous with the transmission.

16. (Currently Amended) The A system according to claim 14 or 15, wherein the reference time point is stored in the drawing device.

17. (Currently Amended) The A system according to claim 14 or 15, wherein the reference time point is stored in the computer system.

18. (Currently Amended) A method for processing information comprising:
receiving buffered position information from a drawing device, the position information being generated when the drawing device is moved over a position-coding pattern on a plurality of tangible sheets associated with first and second filing appliances, the position information including information that is generated before and after time point t_{act} , and further wherein the position information comprises activation information generated at the time point t_{act} , the activation information being indicative of an activation of the second filing appliance;

inserting position information generated before said time point t_{act} in a first information object wherein the first information object is related to a the first filing appliance, further wherein the first information object resides within a computer system and is associated a first application;

inserting position information generated after said time point t_{act} in a second information object, wherein the second information object is related to a the second filing appliance, further wherein the second information object resides within the computer system and is associated with at least one of the first application and a second application.

19. (Currently Amended) The A computer program comprising instructions for

performing the method as claimed in claim 18.

20. (Currently Amended) The A memory medium comprising a computer program as claimed in claim 19.

21. (Previously Presented) The filing appliance of claim 1, wherein the initiation icon is provided with a position-coding pattern.

22. (Currently Amended) A filing device comprising:
a holder for holding a plurality of tangible sheets[[,]]; ~~including~~
at least one first input field ~~which is provided with a position coding pattern and is adapted to be filled in by accepting markings from a drawing device which records, using the position coding pattern, positions in the input field to digitally records information entered in the first input field[[,]];~~
a second input field accepting descriptive information characterizing the digitally recorded information, wherein the descriptive information associates the filing appliance with an information object; and

~~wherein the filing device further includes an initiation icon which upon activation by wherein the drawing device, is adapted to detect the initiation icon and, upon detection of the initiation icon, initiate an operation in a signals the computer system communicating with the drawing device, in which operation to create an information object is created, which is identifiable at least identified based upon the descriptive by the information entered in the second input field.~~

23. (Previously Presented) The filing device of claim 22, wherein the information object electronically represents the filing device.

24. (Currently Amended) A filing device according to claim 22, wherein the filing device comprises an archiving icon, ~~which is arranged~~ wherein a detection of the archiving icon by the

drawing device initiates an operation wherein position information corresponding to strokes of the drawing device, which strokes are generated after a reference time point, is transmitted from the drawing device to the computer system.

25. (Currently Amended) A drawing device comprising:

a sensor for sensing position information from a position-coding pattern on a plurality of tangible sheets associated with first and second filing appliances~~-surface~~; and

a memory for storing the sensed positional information, the position information including information that is generated before and after time point t_{act} , wherein position information sensed before said time point t_{act} is to be inserted in a first information object wherein the first information object is related to ~~a~~the first filing appliance, further wherein the first information object resides within a computer and is associated with a first application, and

wherein position information generated after said time point t_{act} is to be inserted in ~~a~~the second information object, wherein the second information object is related to a second filing appliance, further wherein the second information object resides within the computer system and is associated with at least one of the first application and a second application, and further wherein the position information comprises activation information generated at the time point t_{act} , the activation information being indicative of an activation of the second filing appliance.

26. (New) The filing appliance according to claim 1, wherein the information object is re-accessible by reactivating of the initiation icon.
